My surgery involved a lumpectomy although when I met with the breast surgeon after diagnosis **she suggested I would need a mastectomy**. She thought that the chemo would reduce the tumor but did not believe I would have enough breast tissue after surgery so I would need a mastectomy.

I used thermography throughout chemotherapy to monitor the effect of the chemo. By the **3rd of the 6th chemo treatments my tumor was not evident on the thermoscan**

That changed the surgical prognosis **from mastectomy to lumpectomy**. I asked the surgeon's nurse if she regularly changed her mind. **She said, "NO!"** The radiologist who implanted the surgical "seeds" before surgery **told me that they had not seen the likes of my MRI**. He **could not find my tumor on the MRI** so was going to place the seeds where the tumor used to be.

He wanted to know what I was doing and I **said** that I was ingesting **high levels of a powerful immune support called POLY-MVA**.

He told me that he **had not seen results like this** and **to continue doing what I was doing**. I believe that the **Poly-MVA directed the chemo, protected my good cells, gave me restorative sleep, regular bowels, increased appetite, and gave me abundant energy** before treatment and throughout treatment. This allowed me to **continue exercising on a regular basis- good healthy habit**.

Treatment Summary:

Chemotherapy start date: 3/23/2017

Chemotherapy Medications: 6 doses every 3 weeks

Taxotere, Herceptin, Carboplatin, and Perjeta

Radiation Therapy Start Date: 10/16/2017

Radiation End Date: 11/21/2017

Dose received: 5900 cGy in 28 fractions

Additional Testing ordered by Integrative Medicine Doctor (Dr. Marcus Cobb) and Thermologist (Dr. Anthony Piana)

Pelvic Ultrasound: Negative (Fibroid noted) No problems so no removal

Head/Torso Thermogram: Showed inflammation in upper right quadrant of breast, some inflammation in upper left part of my mouth, some inflammation heading for pelvis which is why ultrasound was performed

DexaScan: Beginning of osteopenia in left hip

SpectraCell Lab testing for vitamin, mineral and amino acid levels

Only thing deficient was the amino acid- Serine

SpectraCell CardioMetabolic Test Results: Low risk for heart, stroke, diabetes Homocysteine levels still too high Taking Homocysteine Supreme supplement 2x/daily

Genetic Testing for gene mutations: No mutations noted on any of my chromosomes so ovaries were not removed

Pap Smear: Negative

Refused Mammography and asked for **MRI of both breasts** with and without contrast. I will continue with MRI yearly for the rest of my life

Results: 6/4/18

No enlarged axillary lymph nodes, no enlarged internal mammary chain lymph nodes, no liver lesion identified, normal marrow signal, no abnormal enhancement in either breast, no mass lesion identified

BEST NEWS EVER!!!!!!!!!!!!
