In my mid-thirties I began to suffer clinical effects **of exposure to defoliants sprayed around the military bases where I served in Vietnam**. Many doctor visits and a two-day battery of inpatient tests revealed nothing. It was necessary to use heating pads to relieve inflammation and discomfort in the rectal area that **was diagnosed in 1994 as prostate cancer** (Gleason 2+2 via needle biopsy).

External beam radiation that year was unsuccessful, since PSA began to rise again within a few years. **In 1999 I began anti-agonist (Zoladex) injections**, which generally worked well until 2005, when a double blockade with Casodex began. However, **in mid-2010 the malignancy became refractory**; PSA velocity averaged a rate of about 10 ug/ml each month. (See the attached charts.) At that rate **it appeared that serious health decline would be inevitable** within months.

I had seen **PolyMVA mentioned in Suzanne Sommers' book(Knockout)** on alternative cancer treatments.

In July 2012, after internet research, **I began dosing PolyMVA at 40 ml/d (two tsp four times a day)**. At that point **PSA was nearly 50 ug/ml**. But within two weeks PSA velocity began to slow, and in another two weeks it stopped completely. **It was a real miracle!**

Since July 2012, **I have used PolyMVA continuously as my main line of defense.** I joined AMARC's Quality of Life Study in October 2012, and markers have remained basically stable in the range of 50s to 60s.

When anti-agonist was discontinued in May 2013, there was a temporary spike in the low 80s. That event could have been an outlier or possibly an indication that some cell lines were still responsive to anti-agonists.

In addition to faith in God, diet, ample clean water, exercise and rest, **my health regimen includes PolyMVA and certain dietary supplements and immune system boosters.** These supplements have been discussed with AMARC's excellent health consultants and with my oncologists.

Spoke to Mr. Peters and **he is doing well.** He still takes 6 tps of Poly MVA per day. He also **shares Poly with his father in law** which has helped to lower his PSA. He put his father in law on **10cc of Poly 3 times daily.** His father in laws' PSA was 35 before starting on Poly and after 1 month the **PSA dropped to 24. Mr. Peters PSA is steady** at 60.

10-13-2015

Since the mid-1970s I **suffered inflammation and discomfort** and sat on electric heating pads for relief. My condition was **diagnosed in 1994 as prostate cancer** (Gleason 2+2 via needle biopsy). External beam radiation that year was unsuccessful, **since PSA began to rise again within a few years.**

In 1999 I began anti-agonist (Zoladex) injections, which generally **worked well until 2005,** when a double blockade with Casodex began. However, in **mid-2010 the tumor became refractory,** and Casodex was **discontinued.**

By mid-April 2011 **PSA velocity began to rise at a rate of about 10 ug/dl each month**. At that rate it appeared that **serious health decline would be inevitable within months**. Decisive and effective action was needed and fast!

I had seen PolyMVA mentioned in **Suzanne Somers' book (*Knockout*)** on alternative cancer treatments. In July 2012 an **alternative medicine clinic near Dallas recommended PolyMVA**. So, after performing internet research, I began dosing **PolyMVA at 40 ml/d (two tsp four times a day)**. At that point **PSA was nearly 50**. But within two weeks PSA velocity began to slow, and in another week or so, it stopped completely and **remained basically stable in the 50s and 60s**. It was a real miracle!

When anti-agonist injections were discontinued in May 2013, **PSA began to rise again**, out of control, **reaching almost 120 points within a year**.

In August 2014 I started a regimen of Zytiga (abiraterone acetate) – a very effective but expensive option usually reserved for metastatic cancer patients. But amazingly, half a dozen CT and other scans of abdomen and chest from 2013 to present have shown no visible metastasis. Clearly, **the electrochemical action of PolyMVA, killing circulating tumor cells (CTCs) in the bloodstream has saved my life**.

In addition to faith in God, diet, ample clean water, exercise (tennis, weight-lifting and brisk walks) and ample rest, my health regimen includes a triple blockade: **PolyMVA three times a day**, anti-agonist injections semiannually, and daily Zytiga orally.

The latter two medicines **control blood testosterone and adrenaline levels** and thus starve the tumor; and **PolyMVA kills off CTCs that enter the bloodstream and try to colonize elsewhere in the body**. I take certain dietary supplements, as well, and **these supplements have been discussed with AMARC's excellent health consultants and with outside oncologists**.

In conclusion, it is clear that **PolyMVA is an ingenious, unique, powerful weapon against metastatic cancer—without harmful side effects**.

PolyMVA's effectiveness is a modern miracle, providing hope and positive, verifiable, economical results. I continue to co-exist with and manage this disease for the long term and am **eternally grateful for PolyMVA and God's blessings**.

James P

5-16-2016

Spoke to James and his wife, Vicky. James is still doing well but they are concerned about **James' 96 year old father in law whose Prostate cancer has progressed**. He is not doing well and we discussed dosage and how to best help him. They also asked about some of his current medications and whether they might interfere with Poly. The elderly father in law **now has metastasis to his bones and liver**.
